ABSTRACT

Steelhead *Oncorhynchus mykiss* in Idaho are monitored to assess hatchery contribution, distribution, and return rates. Coded wire tags (CWT) are retrieved from fish harvested by anglers, and harvest rates are calculated by month and river section.

Creel clerks interviewed 16,781 anglers and examined 3,078 steelhead, or 11.4% of the statewide steelhead harvest estimate (27,063) for river sections creeled for the Lower Snake River Compensation Plan (LSRCP) during the fall of 1999 and spring of 2000. We also retrieved 465 Coded Wire Tags (CWT) from 93 of the 143 unique mark groups released in Idaho through creel efforts. We recovered 65 of the 90 steelhead mark groups produced by the LSRCP, or 72.2% of the total LSRCP groups released. Idaho anglers also harvested fish from six CWT groups released in Washington and Oregon.

We estimate 9,313 (34.4%) of the 27,063 steelhead harvested during 1999-2000 were produced by the Lower Snake River Compensation Plan (LSRCP). An additional 5,553 LSRCP-reared fish returned to hatchery racks or to off-site release locations. Therefore, we accounted for 14,866 steelhead from the LSRCP program, 62.6% of which were harvested.

Jon Hansen Senior Fishery Research Biologist

INTRODUCTION

Steelhead *Oncorhynchus mykiss* and Chinook salmon *O. tshawytscha* are raised in Idaho hatcheries to mitigate for losses caused by the construction of hydroelectric dams. Adults returning to the Salmon River and Clearwater River basins commingle with each other and with wild stocks. In the Snake River, fish destined for Idaho also commingle with adults returning to Oregon and Washington streams.

The main purpose of this report is to show the composition of steelhead in the Idaho fishery and to estimate the adult harvest contribution from juveniles produced in Lower Snake River Compensation Plan (LSRCP) hatcheries. The LSRCP mitigates for four federal dams on the lower Snake River. Contribution to the Idaho fishery is one of the measures of performance of LSRCP fish.

Steelhead are also cultured by Idaho Power Company (IPC) and the US Fish and Wildlife Service (USFWS). The IPC fish are released into the Salmon River and Snake River drainages and USFWS fish are released into the Salmon River and Clearwater River drainages. A summary and discussion of the harvest contribution of these fish is not included in this report. However, harvest data for IPC and USFWS is incorporated into Appendix "A" tables by Coded-Wire-Tag (CWT) release group. The IPC and USFWS release groups are also identified by their rearing hatchery, Niagara Springs Fish Hatchery and Dworshak National Fish Hatchery, respectively, in Appendices B and C. The CWT fish from IPC and USFWS programs provided the basis for in-river return estimates in some instances.

Currently, wild stocks are below escapement goals and protection is necessary to perpetuate those fish. Harvest management of steelhead in Idaho is directed toward harvest of hatchery fish and protection of wild (unmarked) fish. Beginning in 1984, all hatchery-produced steelhead smolts released into Idaho rivers and streams had their adipose fins excised before release so that returning adults could be selectively harvested. Regulations stated that "only steelhead with a missing adipose fin (as evidenced by a healed scar) may be kept." Consequently, the harvest of any wild (unmarked) steelhead was illegal. Table 1 lists the fall and spring steelhead fishing season dates, bag limits and special restrictions in effect for Idaho during 1999 – 2000.

Representative groups of steelhead were marked with CWT prior to release as juveniles. Anglers were interviewed and fish snouts were retrieved in all major harvest areas to recover CWT from the fishery. Information was collected and used to estimate timing, straying, exploitation, harvest distribution, and relative abundance of hatchery stocks. Total harvested numbers were estimated by statewide harvest survey, and the harvest contribution for each hatchery program was derived from tag recoveries. Off-site smolt releases were used as a tool for distributing angler effort and harvest. This report documents some of the behavior and distribution of the returning fish.

Table 1. Steelhead season dates, bag limits, and special restrictions for the Clearwater River drainage, Salmon River drainage, and Snake River, 1999-2000.

River (and Sections)	Fall Season Dates ^a	Bag Limits ^b

Salmon River (10-14)	Jan 1-Mar 31	2, 4, 10	
Salmon River (15-19)	Jan 1-Apr 30	2, 4, 10	
Little Salmon River (20)	Jan 1-Apr 30	2, 4, 10	

^aFall season dates are for catch-and-keep fishing. Fishing for steelhead on a catch-and-release basis was open from August 1 through December 31, 1999 in any water open to fishing for other species except in the Middle Fork Salmon River and South Fork Salmon River and their tributaries. See footnote c for river section exception regarding season dates.

^bBag limits denote daily, possession, and season totals.

[°]Catch-and-keep fishing was open from September 1 – December 31, 1999 on the portion of Section 03 from the mouth to Memorial Bridge of Highway 12 at Lewiston.

OBJECTIVES

Identify the number and proportion of steelhead harvested in the Idaho sport fishery that are produced by LSRCP hatcheries.

Determine adult returns of LSRCP steelhead to Idaho hatcheries and off-site release areas.

DESCRIPTION OF STUDY AREA

Juvenile steelhead are released into the Salmon River drainage and Clearwater River drainage by the LSRCP program. Consequently, Idaho's harvest of LSRCP-produced steelhead primarily occurs in the Snake River, the Clearwater River and the Salmon River. While additional harvest of LSRCP-produced steelhead occasionally occurs in other locations, such as the Boise River and Oxbow Reservoir, the majority of Idaho's steelhead harvest occurs within the central portion of the state (Figure 1; Table 2).

METHODS

Creel Survey

Angler interviews were conducted at check stations, from jet boats and from roving vehicles. Angler interview schedules and intensity were designed to observe maximum numbers of harvested fish. A jet boat was typically used to census anglers on the Clearwater River during the fall and winter months. However, boat density in the spring boat renders census methods impractical so creel checks were conducted at boat ramps. We used check stations and roving techniques to census anglers fishing in the lower and upper Salmon River portions of the project. We used jet boat and boat ramp surveys to census anglers on the Snake River.

Data collected during creel surveys included the number of anglers and hours fished, the number of fish kept or released, wild or hatchery origin of fish kept and released, fork length and sex of fish kept, and the date and river sections where fish were caught. Fish were inspected for tags and fin clips. The snout was removed for CWT retrieval from all fish with an abnormality of its left ventral fin or when use of a portable CWT hand wand detector signaled the presence of a CWT. Snouts were not excised from CWT fish when anglers desired to keep their fish intact.

Water conditions during the fall season are usually conducive to harvest and the interview schedule can be followed. However, during the spring season, high, turbid flows can reduce harvest to near zero. Anglers were not interviewed during periods of very low harvest.

Interview Schedule

- **Lower Snake River (01)** by jet boat with Washington Department of Fish and Wildlife (WDFW) personnel and at boat ramps on alternating weekends for ten weekends during the fall season.
- Lower Clearwater River and North Fork Clearwater River (03 and 05) by roving vehicle one day each week and by jet boat three days each week for 15 weeks in the fall and 12 weeks in the spring season. Interviews were conducted from boat ramps for the last six weeks of the spring season.
- Upper Clearwater River (including the Middle Fork upstream to Clear Creek) and South Fork Clearwater River (04 and 07) by roving vehicle on both rivers for eight weekends in the spring.

Salmon River and Little Salmon River

- **Section 10** by roving vehicle for eight weekends in the fall and four weekends during the spring season (upper roaded portion only).
- **Section 11** by roving vehicle for eight weekends in the fall and six weekends in the spring.
- **Sections 12 and 13** by a check station at the old lumber mill site near Riggins for eight weekends in the fall and six weekends in the spring.

- **Sections 14 and 15** by a check station near North Fork for eight weekends in the fall and four weekends in the spring.
- **Section 16** by roving vehicle for eight weekends in the fall and seven weekends in the spring.
- **Section 17** by roving vehicle for six weekends during the fall in the downriver one-quarter of the section and three weekends in the spring.
- **Sections 17 and 18** by a check station near Challis for three weekends in the spring.
- Section 18 by roving vehicle for five weekends in the spring.
- **Section 19** by roving vehicle for five weekends in the spring.
- Section 20 by roving vehicle for 11 weekends in the spring.

Data Analysis

Monthly harvest estimates by river section were obtained from a statewide telephone survey (Appendix D). We calculated a sample rate by summing the number of fish checked for marks from each river section by month and dividing it by the corresponding monthly statewide harvest estimate. Fish that were not seen by creel clerks during angler interviews were not included in sample rate calculations. The harvest of hatchery fish by CWT code was calculated as the number of tags recovered divided by the monthly sampling rate (Appendix A). We estimated harvest of unmarked release groups by using harvest rates from marked companion release groups. Total returns were the sum of harvest and hatchery returns by release group. We defined the exploitation rate as the harvest estimate divided by the total return of fish. No attempt was made to estimate the number of fish that spawned naturally or died prior to spawning.

Stock Separation

We categorized steelhead as either A-strain (<77.5 cm FL) or B-strain (≥77.5 cm FL) for dam count purposes (Ball and White 2001). The data was adjusted for size overlap between the two groups after it was separated by category. For a more detailed discussion regarding dam counts and overlap adjustments see Ball and White (2001).

Oregon Department of Fish and Wildlife (ODFW) personnel trap steelhead at the Bonneville Dam fish ladder. They measure fork length, record the presence or absence of an adipose fin, and take scales from the fish samples. The ODFW then supplies Idaho Department of Fish and Game (Department) with copies of the data, including scale readings (Appendix E).

National Marine Fisheries Service (NMFS) personnel sample steelhead at Lower Granite Dam each week through the steelhead run. The NMFS supplies the Department with the numbers of fish in each of four categories: wild steelhead <77.5 cm FL, hatchery steelhead <77.5 cm FL, wild steelhead \geq 77.5 cm FL, and hatchery steelhead \geq 77.5 cm FL (Appendix F).

We categorized fish into four length groups based on fishery type, strain, age, and sex for harvest purposes. We developed the following categories where mixed stock fisheries of A and B fish occur, such as in the Salmon River and Snake River: A-strain 1-ocean males are <68 cm FL;

A-strain 2-ocean males are ≥68 cm FL, A-strain 1-ocean females are ≤65 cm FL; and A-strain 2-ocean females are >65 cm FL. Likewise, B-strain 2-ocean and 3-ocean males are >79 cm FL, and B-strain 2-ocean and 3-ocean females are >75 cm FL. Currently, we are unable to separate B-strain 1-ocean fish from A-strain 2-ocean fish based on length frequencies where mixed stock fisheries occur.

Where fishery stocks are separate, such as in the Clearwater River drainage, we developed the following categories: B-strain 1-ocean males are \le 73 cm FL, and B-strain 2-ocean and 3-ocean males are \ge 73 cm FL. Likewise, B-strain 1-ocean females are \le 68 cm FL, and B-strain 2-ocean and 3-ocean females are \ge 68 cm FL.

RESULTS

Creel Survey

We interviewed 16,781 anglers that had harvested 3,308 hatchery fish and released 1,821 and 964 hatchery and wild fish, respectively, during the fall 1999 and spring 2000 seasons (Tables 3-17). We physically examined 3,078 hatchery fish for marks, which represented 11.4% of the total steelhead harvest of 27,063 fish for river sections creeled for LSRCP (Table 18).

We removed 512 snouts for CWT retrieval from fish with clipped left ventral fins or from fish that triggered positive detection signals using a portable CWT wand detector. We recovered 474 CWT from 99 different mark groups from sampled snouts. The overall proportion of tags recovered from the number of fish checked for marks was 15.4%. The number of tags recovered, the estimated harvest of tag code groups by month and river section, and the total estimated harvest of tag code groups for the fall and spring seasons are also listed in Appendix A. Of the 99 mark groups that yielded CWT in the fishery, 93 were from releases in Idaho (Appendices A, B, and C).

^aStatewide steelhead harvest survey data from Thomas J. McArthur, IDFG, (unpublished).

The other six mark groups were recovered from two Oregon and four Washington releases (Appendices A and G). One Oregon tag group was from a release in the Imnaha River and the other Oregon tag group was from a release in the Wallowa River. The four Washington tag groups were from two releases in the Grande Rhonde River, one release in the Touchet River, and one release in the Tucannon River.

We recovered several A-strain 5-year-old fish from CWT groups 10/35/12 and 10/35/13 in the Idaho fishery (Table 19). We do not know if the 5-year-old fish held over in freshwater or the ocean

Adult Returns to Idaho

We estimated that at least 12,638 A-strain steelhead and 2,207 B-strain steelhead reared by LSRCP hatcheries returned to Idaho during 1999-2000 (Table 19). Adult returns from the LSRCP program, verified by CWT recoveries, were from releases into the Salmon River and Clearwater River drainages. However, CWT from LSRCP releases were also recovered from the fishery in the Snake River bordering Idaho and Oregon – Washington. The estimated return of adult steelhead to Idaho during 1999–2000 from the LSRCP program was 14,845 fish (Table 19). The return estimate was comprised of harvest by Idaho anglers, hatchery returns, and off-site escapement estimates, which are included with return data to hatcheries. The LSRCP contribution to Idaho's hatchery steelhead harvest was 9,312 fish during 1999-2000. This number does not include an estimated 222 LSRCP-reared fish from Oregon and Washington harvested by Idaho anglers (Appendices A and G). Harvest of LSRCP-reared fish from Idaho that occurred downstream of Snake River section 01 is reported by Washington and is not included in this report.

Table 19. Summary of 1999-2000 harvest estimates and hatchery returns of steelhead produced by LSRCP hatcheries.

Fall release.

Selway River stock. Harvest derived by expansion of right ventral fin clip recoveries in fisheries.

Fingerling release.

Includes 135,837 2-year reared fish.

Release Group Exploitation by Run Year

Sawtooth Fish Hatchery, East Fork Satellite Facility, and Squaw Creek Pond

The exploitation rate was 65% for A-strain 1- and 2-ocean steelhead returning to Sawtooth Fish Hatchery during 1999-2000 (Table 19). The exploitation rate was 73% for B-strain steelhead returning to the East Fork Trap. We did not estimate an exploitation rate for B-strain steelhead returning to Squaw Creek Pond because they were not differentially marked.

Salmon River and Associated Tributary Off-Site Areas

Exploitation rates for A-strain steelhead returning to off-site release areas at Torreys Hole, McNabbs Point, Brunos Bridge, Cottonwood Campground, Shoup Bridge, Lemhi River, Red Rock, North Fork, and the Little Salmon River were: 90%, 85%, 46%, 80%, 68%, 61%, 71%, 85%, and 37%, respectively. Exploitation rates for B-strain steelhead returning to off-site release areas at Slate Creek (upper Salmon River) and the Little Salmon River were 72% and 49%, respectively.

Clearwater Fish Hatchery

Exploitation rates for B-strain steelhead returning to off-site release areas at: Clear Creek, South Fork Clearwater River, Red River, Crooked River and South Fork Red River were: 36%, 44%, 0%, 48%, and 0%, respectively.

Completed Adult Returns by Release Year

Sawtooth Fish Hatchery and East Fork Satellite Facility

Sawtooth Fish Hatchery released 742,460 A-strain steelhead smolts during 1997. We estimate 1,863 returned as 1-ocean adults in 1998-1999 (Hansen and White 2004) and 641 returned as 2-ocean adults in 1999-2000 (Table 19). The total return of 2,504 fish represents an SAR (smolt to adult return) of 0.34%.

Hatchery personnel released 490,374 B-strain steelhead into the East Fork Salmon River during 1996. We estimate 54 returned as 1-ocean adults in 1997-1998 (Hansen and White 2003), 173 returned as 2-ocean adults in 1998-1999 (Hansen and White 2004), and no 3-ocean adults returned in 1999-2000 (Table 19). The total return of 227 fish represents an SAR of 0.05%.

Salmon River and Associated Tributary Off-Site Areas

Hatchery personnel released 63,916 A-strain steelhead into Torreys Hole during 1997. We estimate 176 returned as 1-ocean fish in 1998-1999 (Hansen and White 2004) and 119 returned as 2-ocean fish in 1999-2000 (Table 19. The total return of 295 fish represents an SAR of 0.47%.

Hatchery personnel released 230,417 A-strain steelhead near McNabbs Point during 1997. We estimate 504 returned as 1-ocean fish in 1998-1999 (Hansen and White 2004) and 194 returned as 2-ocean fish in 1999-2000 (Table 19). The total return of 698 fish represents an SAR of 0.30%.

Hatchery personnel released 150,280 A-strain steelhead near Brunos Bridge during 1997. We estimate 329 returned as 1-ocean fish in 1998-1999 (Hansen and White 2004) and 127 returned as 2-ocean fish in 1999-2000 (Table 19). The total return of 456 fish represents an SAR of 0.30%.

Hatchery personnel released 241,510 A-strain steelhead into the Lemhi River during 1997. We estimate 789 returned as 1-ocean fish in 1998-1999 (Hansen and White 2004) and 150 returned as 2-ocean fish in 1999-2000 (Table 19). The total return of 939 fish represents an SAR of 0.39%.

Hatchery personnel released 134,310 A-strain steelhead near North Fork during 1995. We estimate 479 returned as 1-ocean fish in 1998-1999 (Hansen and white 2004) and 261 returned as 2-ocean fish in 1999-2000 (Table 19). The total return of 740 fish represents an SAR of 0.55%.

Hatchery personnel released 342,281 A-strain steelhead into the Little Salmon River during 1997. We estimate 322 returned as 1-ocean fish in 1998-1999 (Hansen and White 2004) and 585 returned as 2-ocean fish in 1999-2000 (Table 19). The total return of 907 fish represents an SAR of 0.26%.

Hatchery personnel released 236,297 B-strain steelhead into Slate Creek (upper Salmon River) during 1996. We estimate 5 returned as 1-ocean adults in 1997-1998 (Hansen and White 2003), 34 returned as 2-ocean adults in 1998-1999 (Hansen and White 2004), and no 3-ocean adults returned in 1999-2000 (Table 19). The total return of 39 fish represents an SAR of 0.02%.

Hatchery personnel released 403,291 B-strain steelhead into the Little Salmon River during 1996. We estimate 52 returned as 1-ocean adults in 1997-1998 (Hansen and White 2003), 610 returned as 2-ocean adults in 1998-1999 (Hansen and White 2004), and no 3-ocean adults returned in 1999-2000 (Table 19). The total return of 662 fish represents an SAR of 0.16%.

Clearwater Fish Hatchery

Hatchery personnel released 298-442 B-strain steelhead into Clear Creek during 1996. We estimate 9 returned as 1-ocean adults in 1997-1998 (Hansen and White 2003), 329 returned as 2-ocean adults in 1998-1999 (Hansen and White 2004), and 14 returned as 3-ocean fish in 1999-2000 (Table 19). The total return of 352 fish represents an SAR of 0.12%.

Hatchery personnel released 14,362 B-strain steelhead into Red River during 1996. We estimate no 1-ocean adults returned in 1997-1998 (Hansen and White 2003), 2 returned as 2-ocean adults in 1998-1999 (Hansen and White 2004), and no 3-ocean fish returned in 1999-2000 (Table 19). The total return of 2 fish represents an SAR of 0.01%.

Hatchery personnel released 428,513 B-strain steelhead into the South Fork Clearwater River during 1996. We estimate no 1-ocean adults returned in 1997-1998 (Hansen and White 2003), 952 returned as 2-ocean adults in 1998-1999 (Hansen and White 2004), and 23 returned as 3-ocean fish in 1999-2000 (Table 19). The total return of 975 fish represents an SAR of 0.23%.

Hatchery personnel released 47,226 and 46,018 B-strain steelhead into the South Fork Red River and Crooked River, respectively, during 1996. We did not recover any CWT from these groups, nor were there any PIT-tag detections of returning adult fish from these groups at Lower Granite Dam during the 1997-98, 1998-1999, or 1999-2000 run years.

Hatchery Straying

Department and USFWS personnel recovered 858 CWT from hatchery steelhead at hatchery racks in Idaho, excluding Hells Canyon, during 2000. A total of 348 CWT were recovered at Dworshak National Fish Hatchery (DNFH) and Kooskia National Fish Hatchery (KNFH) on the Clearwater River, and 510 CWT at Pahsimeroi Fish Hatchery (PFH), East Fork trap, and the Sawtooth Fish Hatchery (SFH) on the upper Salmon River.

None of the direct hatchery released fish from the upper Salmon River strayed to a different hatchery rack in Idaho. Sixteen off-site released fish from the upper Salmon River returned to the hatchery rack at the PFH. None of the fish directly released from DNFH strayed to a different hatchery rack in Idaho. Thirty-eight fish returned to the DNFH rack from off-site releases into the South Fork of the Clearwater River. Twenty-three fish released into Clear Creek, near KNFH, returned to the DNFH rack. One fish returned to the KNFH rack and one to the DNFH rack from Astrain releases of fish into the Little Salmon River.

DISCUSSION

There are similarities among categories when we conduct between year comparisons of 1998-1999 (Hansen and White 2004) and 1999-2000 report years. For example, we estimate anglers caught 9,312 (Table 19) LSRCP-reared steelhead during 1999-2000 compared to 9,318 fish during 1998-1999 (Hansen and White 2004). Our data shows the number of fish released, number of fish examined for marks, mark rates, and sample rates were also similar for both reports.

Lower Granite Dam counts of 73,811 steelhead were slightly greater during 1999-2000 (Appendix F) compared to 70,721 fish for 1998-1999 (Hansen and White 2004). The present statewide harvest estimate of 27,063 fish (Table 18) reflects the slight increase of steelhead counted at Lower Granite Dam during 1999-2000. However, the dam count and statewide harvest estimate change is not reflected by an increase in the number of returning adult fish (9,312) contributed by LSRCP (Table 19). Creel survey notes and report data show that fishing conditions and exploitation rates generally improved during 1999-2000. Our present SAR is less for most completed return groups compared to 1998-1999 (Hansen and White 2004) and may account for the lack of change regarding the current LSRCP steelhead contribution number.

There was a 40% increase of wild A stock steelhead escapement and a 39% reduction of wild B stock escapement over Lower Granite Dam during 1999-2000 (Appendix F) compared to 1998-1999 (Hansen and White 2004). Catch-per-unit-effort data (Tables 3 – 17) show a 55% increase (964 total) regarding the number of wild fish released and a 25% increase (1,821 total) regarding the number of hatchery fish released by anglers compared to 1998-1999 (Hansen and White 2004a). We estimate that anglers fished 144 and 104 hours per wild fish caught during 1998-1999 (Hansen and White 2004) and 1999-2000, respectively.

Our data shows B-strain steelhead that originated from upper Salmon River stock returned at a greater rate compared to Dworshak stock (Table 20). This finding is consistent with every yearly comparison made thus far (Ball 1998, Ball 1999, Hansen and White 2003, Hansen and White 2004). We may make our last comparison of East Fork Salmon River stock and Dworshak stock steelhead in the 2000-2001 annual report, as the current data clearly shows East Fork Salmon River stock returns to the upper Salmon River at a greater rate compared to Dworshak stock.

Typically, we detect few or none of the fall releases, fingerling releases, or right ventral fin clipped fish from tributaries such as Red River, the South Fork Red River, and Crooked River during fisheries (Ball and White 2001, Hansen and White 2003; 2004). Sometimes, juvenile mark rates are too low to adequately determine adult return rates. However, when mark rates are adequate for these groups, our detection rate in the fishery is still low or nonexistent. Therefore, managers should review experimental releases that occur in the upper South Fork Clearwater River tributaries.

Table 20. Coded wire tag (CWT) recoveries of East Fork Salmon River steelhead releases – East Fork stock vs. Dworshak stock.

^a Downriver recovers queried from Pacific States Marine Fisheries Commission CWT database on February 2, 2002.

^b Idaho in-state harvest only

^c includes one stray to Oxbow Fish Hatchery.

^d includes one stray to Pahsimeroi Fish Hatchery.

^e includes two strays to Slate Creek temporary weir.

f ND = No data.

RECOMMENDATIONS

Continue to include coded wire tags in each major smolt release group that are representative in size, time of release, and fish health.

Review coded wire tag marking rates in terms of likelihood of recovery given creel sampling rates (especially for Clearwater River release groups and "test" groups).

Evaluate smolt-to adult survival, contribution to the sport fishery, and distribution of adults returning from off-site releases. Explore possible differential survival of off-site released fish as compared to direct hatchery released fish.

Enumerate adult returns in terms of contributions to fisheries and rack returns including fish released from the Squaw Creek Pond acclimation site (located near the upper Salmon River).

ACKNOWLEDGMENTS

Marsha White and Ellen Smith, Idaho Department of Fish and Game, assisted with data compilation and word processing. Bill Horton, Idaho Department of Fish and Game, provided manuscript review. Judy Dillon and Chris Harrington, Idaho Department of Fish and Game, provided coded wire tag analysis and verification for Idaho fisheries. Ralph Roseberg, U.S. Fish and Wildlife Service, provided data from Dworshak National Fish Hatchery. Joseph Bumgarner and Jerry Dedloff, Washington Department of Fish and Wildlife, cooperated with data collection and compilation of Snake River information. Brett Morgan, Oregon Department of Fish and Wildlife, provided adult sample data for Bonneville Dam. Jerry Harmon, National Marine Fisheries Service, provided adult sample data for Lower Granite Dam.

Nat. = Naturally-produced.
All fish measured in centimeter fork length.

Hatch. = Hatchery origin.

Estimates adjusted for overlap in lengths of A-strain and B-strain steelhead. Two percent of naturally produced A-strain steelhead are longer than 77 cm. Thirty-six percent of naturally-produced B-strain fish are shorter than 78 cm.

Appendix F. Estimated steelhead run composition at Lower Granite Dam, June 1 - December 15, 1999, and March 1 - May 31, 2000.

Adjusted Total ^d												12,311		-1,273	

^a Nat. = Naturally-produced.

^b All fish measured in centimeter fork length.

^c Hatch. = Hatchery origin.

Estimates adjusted for overlap in lengths of A-strain and B-strain steelhead. Fourteen percent of naturally-produced A-strain steelhead are longer than 77 cm. Thirty-six percent of naturally-produced B-strain steelhead are shorter than 78 cm. The model calculates adjusted estimates as negative numbers when the estimated number of naturally-produced fish < 77.5 cm fork length is more than 6.15 times the number of naturally-produced fish > 77.5 cm fork length.

Miscellaneous coded wire tag steelhead groups that were recovered by Idaho anglers, 1999 - 2000. Appendix G.
