## EXECUTIVE SUMMARY

Bluff Point Wind Energy Center (project) is an operational 119.7-megawatt (MW) wind farm equipped with 57 General Electric 2.1 MW wind turbine generators located in Jay and Randolph counties, Indiana. The project consists of approximately 23,613 acres and is located approximately five miles south of the city of Portland in east-central Indiana. NextEra Energy Bluff Point, LLC (BPW) contracted Atwell, LLC (Atwell) to determine the potential impact on bats during the spring, summer, and fall seasons of 2021.

In March 2021, BPW submitted a Habitat Conservation Plan (HCP) to the U.S. Fish and Wildlife Service – Indiana Field Office (USFWS – INFO) in support of an Incidental Take Permit (ITP) for federally endangered Indiana bats (*Myotis sodalis*) and northern long-eared bats (*Myotis septentrionalis*). The USFWS – INFO issued an ITP on March 25, 2021 which authorizes the take of 165 Indiana bats and 84 northern long-eared bats over the 30-year permit term and is subject to compliance with, and implementation of the HCP. The Bluff Point Wind Energy Center has been operating under the ITP requirements since April 1, 2021 which included conducting post-construction mortality monitoring for bats.

In total, 897 road and pad plot and 414 full plot searches were completed from April 5, 2021, through October 14, 2021, for standardized surveys. In all, 57 turbines were searched during the spring and fall seasons, and 32 turbines were searched within the USFWS designated buffer areas during the summer. A preliminary pre-spring “clearance” search was performed at all 57 turbines on March 29 to April 2, 2021. A pre-fall “clearance” search was performed at 25 turbines that were not searched during the summer season on July 26 to 30, 2021.

During the spring, summer, and fall, a total of 134 bats representing six species were found during standardized searches, including eastern red bat (*Lasiurus borealis*; 52 fatalities), silver-haired bat (*Lasionycteris noctivagans*; 47 fatalities), hoary bat (*Lasiurus cinereus*; 17 fatalities), big brown bat (*Eptesicus fuscus*; 13 fatalities), Seminole bat (*Lasiurus seminolus*; one fatality) and evening bat (*Nycticeius humeralis*; one fatality). Three bats were identified as either eastern red bat or Seminole bat but could not be identified to species. A total of two state endangered evening bats were found during the 2021 study period, including one during standardized surveys (listed above) and one found incidentally.

In total, 120 searcher efficiency trial carcasses consisting of bat carcasses and bat surrogates (i.e., commercially available mice) were placed throughout the study period. In the spring, searcher efficiency rates were 87.5% and 57.1% at road and pad plots and full plots, respectively. In the summer, searcher efficiency rates were 98.3% and 55.6% at road and pad plots and full plots, respectively. In the fall, searcher efficiency rates were 88.9% and 66.7% at road and pad plots and full plots, respectively. In total, 120 carcass persistence trials were placed throughout the study.

The estimated overall median probabilities of persistence by day 3 was 0.84, 0.85, and 0.59 in spring, summer, and fall, respectively. The estimated overall median probabilities of persistence by day 7 was 0.68, 0.69, and 0.38 in spring, summer, and fall, respectively.

The spring, summer, and fall bat fatality estimates were 1.96 bats/turbine (0.93 bats/MW), 2.23 bats/turbine (1.06 bats/MW) and 39.14 bats/turbine (18.64 bats/MW), respectively.

No Indiana or northern long-eared bat carcasses were found during standardized surveys. The median take estimate, based on modelling for each species, was one fatality in 2021. The estimated overall detection probability was 0.124 (95% confidence interval: 0.103, 0.147;  $Ba = 104.5216$  and  $Bb = 737.1087$ ) and the mean mortality rate ( $\lambda$ ) was 4.08 (95% confidence interval: 0.004, 20.570).

## 1 INTRODUCTION

NextEra Energy Bluff Point, LLC (BPW) is a limited liability company and an indirect wholly owned subsidiary of NextEra Energy Resources, LLC (NextEra). Bluff Point Wind Energy Center (project) is an operational 119.7-megawatt (MW) wind farm equipped with 57 General Electric 2.1 MW wind turbine generators located in Jay and Randolph counties, Indiana (Figure 1).

BPW contracted Atwell, LLC (Atwell) to perform post-construction mortality monitoring (PCMM) surveys and evaluate the potential impact from project operations on bats during the 2021 season. This report documents the results of that work. The survey and statistical methods were developed in coordination with U.S. Fish and Wildlife Service (USFWS) and incorporated relevant guidance and research findings.

This study was conducted under a Habitat Conservation Plan (HCP) that was submitted to the USFWS in support of an application for an Incidental Take Permit (ITP; see Section 1.3). This report covers the first year of baseline PCMM studies for the project since implementation of the HCP.

### 1.1 STUDY AREA

The project consists of approximately 23,613 acres and is located approximately five miles south of the city of Portland in east-central Indiana (Figure 1). The project spans portions of Madison, Pike, and Jefferson townships within Jay County, and portions of Franklin, Ward, and Jackson townships within Randolph County.

The topography within the project varies, with elevations ranging from approximately 980 and 1,060 feet (ft) above mean sea level. Portions of the project are relatively flat, and many areas are moderately undulating.

Overall, the project is dominated by agriculture consisting mostly of corn (*Zea mays*) and soybeans (*Glycine max*). According to the 2016 National Land Cover Database, approximately 85.0% of the land is classified as cultivated crops (20,080.50 acres), followed by 7.3% (1,721.39 acres) classified as deciduous forest, 4.1% (963.41 acres) of developed/open space, and 2.3% (531.29 acres) classified as hay/open pasture. Herbaceous areas, open water, woody and emergent herbaceous wetlands, evergreen and mixed forest, developed areas, shrub/scrub, and barren land collectively make up approximately 1.3% (316.41 acres) of remaining land uses (Figure 2) (MRLC 2019). Conservation Reserve Program (CRP) land is also located within the project area.

## 1.2 BUFFERED AREAS

In January 2012, USFWS and BPW established 1,000 ft protective buffers around forested lands that were identified as potential summer habitat for the federally endangered Indiana bat and federally threatened northern long-eared bat through desktop research, on-site investigation, and 2011 mist netting and telemetry surveys. These protective buffers (hereafter referred to singularly as a “bat avoidance buffer”) cover 13,524 acres of the 23,613-acre project and include 32 turbines from the total project array (Figure 3). Survey parameters and turbine operations for the spring, summer, and fall seasons of 2021 are addressed in the HCP, which designates specific curtailment strategies (see Section 1.3) for turbines within this buffered area.

## 1.3 INCIDENTAL TAKE PERMIT

BPW has determined that operation of the project may result in take of the federally endangered Indiana bat (*Myotis sodalis*) and the federally threatened northern long-eared bat (*Myotis septentrionalis*). Section 9(a)(1)(B) of the Endangered Species Act (ESA), 16 U.S. Code (U.S.C.) § 1538 (a)(1)(B) states that it is unlawful for any person to “take” an endangered species. In addition, take of any threatened species is prohibited pursuant to 50 Code of Federal Regulations (C.F.R.) § 17.31, issued by the USFWS under the authority of Sections 4(d) and 9(a)(1)(G) of the ESA, 16 U.S.C. §§ 1533 (d) and 1538(a)(1)(G), respectively. Under the ESA, otherwise lawful activities that may cause or result in the incidental take of federally threatened or endangered species is prohibited. Section 10 of the ESA allows for certain limited exceptions to the ESA’s prohibitions for private actions. Section 10(a)(1)(B) of the ESA provides a mechanism for the USFWS to issue an ITP that authorizes the take of a species listed as threatened or endangered, provided that the take is incidental to, and not the purpose of, the operation of the otherwise lawful activity.

In March 2021, BPW submitted to the U.S. Fish and Wildlife Service – Indiana Field Office (USFWS – INFO) a final HCP in support of that ITP application and in accordance with the requirements set forth under Section 10(a)(1)(B) of the ESA, as amended, and applicable USFWS guidance documents (Atwell 2021).

On March 25, 2021, the USFWS – INFO issued BPW an incidental take permit (Permit Number: ESPER0005513), which authorizes the take of 165 Indiana bats and 84 northern long-eared bats over the 30-year permit term and is subject to compliance with, and implementation of the HCP. BPW seeks to reduce take of Indiana and northern long-eared bats by at least 50% from the authorized 30-year take limit through careful project planning and turbine siting (implemented prior to construction of the project), as well as implementation of operational curtailment strategies (Atwell 2021). These curtailment strategies are described in Section 1.3.1.

BPW has developed four post-construction mortality monitoring protocols to be used for the project: Preliminary Monitoring, Baseline Monitoring, Implementation Monitoring, and Adaptive Management Monitoring. Details of these protocols are described within the HCP (Atwell 2021). The timing of these protocols is implemented as follows:

- BPW performed preliminary monitoring at the project in 2018, 2019, and 2020. These studies were conducted under a technical assistance letter (TAL) to allow for operations while BPW prepared the HCP.
- Baseline monitoring will be conducted for the first three years of operation under the ITP.
- Implementation monitoring will be conducted from year 4 through year 30.
- Adaptive management monitoring will occur for two years following any deviations from avoidance and minimization measures (AMMs) outlined in the HCP, including if any short or long-term trigger has been met (see Section 3.7.1).

2021 is the first year of PCMM studies for the project since implementation of the HCP. As such, PCMM studies were conducted under the baseline monitoring protocol.

To satisfy ITP report requirements, this report summarizes estimates of bat mortality and the results of take compliance monitoring at the project completed for spring, summer, and fall 2021 under the March 25, 2021 ITP.

### **1.3.1 ITP Minimization Measures**

The following minimization measures were proposed within the March 2021 HCP and authorized under the March 25, 2021 ITP as a means of reducing Indiana bat and northern long-eared bat take over the permit term:

- Curtailment of all spring turbine operations by feathering to a cut-in speed of 3.0 meters per second (m/s) based on a 10-minute rolling average from ½ hour before sunset to ½ hour after sunrise during the spring migratory season (April 1 to May 15) when ambient temperature is above 10 degrees Celsius (°C).
- Due to the potential presence of resident Indiana bats and northern long-eared bats within the project boundary during the summer season (May 16 to July 31), 32 turbines within a 1,000 ft bat avoidance buffer were feathered to a cut-in speed of 6.0 m/s based on a 10-minute rolling average from ½ hour before sunset to ½ hour after sunrise from May 16 to July 31 when ambient temperature is above 10°C. Twenty-five turbines located outside of the 1,000 ft bat avoidance buffer were feathered up to 3.0 m/s based on a 10-minute rolling average from ½ hour before sunset to ½ hour after sunrise from May 16 to July 31 when ambient temperature is above 10°C.

- Curtailment of all fall turbine operation by feathering to a cut-in speed of 5.0 meters/second (m/s) based on a 10-minute rolling average from ½ hour before sunset to ½ hour after sunrise during the fall migratory season (August 1 – October 15) when ambient temperature is above 10°C.

The USFWS requested data verifying 2021 operational compliance for turbines 2, 14, 31, 33, 48, and 56 on April 1, May 6, May 28, June 17, July 20, August 2, September 17, and October 11. This data is provided in Appendix A.

## 1.4 STUDY OBJECTIVES

The objectives of the study were to:

- Perform scheduled carcass searches and associated bias trials for spring, summer, and fall seasons (in accordance with the HCP)
- Collect information on bat fatalities found during the search period at the project
- Evaluate and estimate project-specific bat mortality estimates for each survey season
- Estimate take of Indiana and northern long-eared bats (i.e., covered species) to monitor compliance with limits authorized in the ITP.

## 2 SURVEY METHODS

### 2.1 STANDARDIZED FATALITY SEARCHES

Standardized fatality monitoring occurred in the spring (April 5 to May 13, 2021), summer (May 17 to July 30, 2021), and fall (August 2 to October 14, 2021). In the weeks prior to the spring and fall seasons, a “clearance” search was performed to remove any carcasses from standardized search plots. Clearance searches were conducted at all 57 turbines on March 29 to April 2, 2021 and at the 25 turbines located outside the 1,000 ft bat avoidance buffer on July 26 to 30, 2021. One turbine (turbine 47, which is within the bat avoidance buffer) could not be searched during the last week of summer surveys or first two weeks of fall surveys due to turbine maintenance. Therefore, a clearance search for this turbine was conducted on August 16, 2021 (during the third week of fall surveys). Any carcasses located during clearance searches were designated as incidental and were excluded from analysis.

Turbines were assigned one of two search plot types: road and pad plot or full plot. Road and pad plots were searched out to 80 meters (m) from the center of the turbine. Searchers scanned the entire surface area of the road and pad for carcasses by walking transects, with the initial survey start location at 80 m from the turbine (Figure 4). Full plot search areas comprised an 80 m by 80 m plot with the wind turbine located at the center of the search area. Full plots were mowed

in order to keep vegetation low and increase searcher efficiency. Plots were surveyed by walking 13 linear transects, each approximately 6 m wide, until the entire plot was surveyed (Figure 4). Of the 57 total turbines at the project, 39 were searched as road and pad plots and 18 were searched as full plots. Each turbine's assigned plot type remained the same throughout the monitoring period.

During the spring and fall migration seasons, all 57 turbines were generally searched once per week; 18 turbines were searched as full plots and only road and pad searches were conducted at the remaining 39 turbines. During the summer season, only turbines located within the 1,000 ft bat avoidance buffer were searched, once per week, with 10 turbines searched as full plots and 22 turbines searched as road and pad plots (32 total turbines searched). Some turbines, on occasion, were not searched during a particular week due to turbine maintenance or inclement weather conditions (e.g., lightning, impassable roads). The lack of searches at some turbines during the scheduled timeframe was accounted for during statistical analysis.

Standardized fatalities were defined as those found within the scheduled search window and search area. Incidental finds were defined as fatalities found outside of the scheduled search window or search area (i.e., off plot). Incidental finds were not included in fatality estimates but are reported in Appendix B-1.

For each bat fatality found, the following data were collected:

- Unique carcass ID
- Survey date and time
- Turbine (i.e., plot) number
- Distance and bearing from the nearest turbine
- UTM coordinates
- Species
- Carcass sex, age, and reproductive condition (when possible)
- Carcass condition (intact, partial, dismembered, fur spot(s), or other)
- Forearm length, when possible
- Ground cover where fatality was found
- Estimated time of death
- Current weather conditions / previous night weather conditions.

When avian fatalities were encountered during searches, the same data as above were generally collected for the carcass; however, avian fatalities were not included in this analysis but are reported in Appendix B-2.

## 2.2 SEARCHER EFFICIENCY TRIALS

The objective of searcher efficiency trials was to correct for detection bias by adjusting for trial carcasses found compared to total carcasses available to the searcher. Searcher efficiency trials were conducted twice each season for spring and summer. Trials were conducted blindly so the searcher was not aware of when trials were being conducted. Carcasses used for the trials included bats (eastern red bat, silver-haired bat, big-brown bat, which were 2019 and 2020 fatalities with confirmed species identifications found on site) and commercially available dark, large (i.e., 18 – 30 grams) mice (RodentPro.com, LLC 2021). Bat carcasses found on site were only used for trials after species ID was confirmed by a permitted bat biologist (Aaron McAlexander; Permit ID: TE780020D-0) and hair and tissue samples had been taken from the bat carcass. A total of 120 trial carcasses were placed, including 40 in the spring, 40 in the summer, and 40 in the fall. A total of 30 carcasses were placed at full plot locations, and 90 were placed at road and pad plot locations.

Date, species (bat or mouse), turbine number, distance from the turbine, and direction from the turbine were recorded prior to placement within the plot. Turbines were randomly selected for the searcher efficiency trial and no more than two carcasses were placed at a single turbine. Carcasses were discreetly marked (in a manner so the marking did not influence searcher detection) to indicate that the carcass was part of the study. Any trial carcasses that were missed on the first search following placement were collected and were not available to be found during subsequent searches.

## 2.3 CARCASS PERSISTENCE TRIALS

Carcass persistence trials were used to determine the length of time a carcass would remain within the search area before being scavenged (e.g., by scavengers, insects) or removed from the search area by another means (e.g., weather event, agricultural tilling). Carcass persistence trials were conducted twice each season. Carcasses used for the trials were obtained from the same sources as the searcher efficiency trial carcasses. For each trial, 20 carcasses were placed at randomly selected turbines (40 carcasses per season; 120 carcasses total). Carcasses were typically checked by the searcher on Days 1, 2, 3, 4, 7, 10, 14, 21, and 30, as survey conditions allowed. Condition of each carcass was recorded as intact, signs of scavenging, fur spot, or missing during each day of observation. Once the 30-day trial concluded, remaining carcasses were removed.

### **3 STATISTICAL METHODOLOGY**

#### **3.1 GENEST**

Analyses were performed using a Generalized Fatality Estimator (GenEst) v1.4.4 (Dalthorp et al. 2018; Simonis et al. 2018). This program uses five separate data sources and user-populated general inputs to run three separate, but related, analyses. The three analyses (discussed in further detail below) used to determine the mortality rate estimation include searcher efficiency, carcass persistence, and density-weighted proportion (DWP). DWP was calculated separately for each turbine based on the total number of observed carcasses, their distances from the nearest turbine, and area of the plot searched and was input into GenEst. These analyses, combined with the carcass observation data and a known search schedule, ultimately provide a median estimate of the number of fatalities at a wind facility while taking into consideration imperfect detection probability. GenEst provides a median estimate rather than a mean because the mortality probability distribution is generally right-skewed, which is not uncommon for mortality data. Because a mean estimate may be strongly influenced by the degree of skewness (Simonis et al. 2018), the median is a more robust measure.

GenEst uses a sophisticated, carcass-specific detection probability to provide fatality estimates. However, for simplicity, the program provides basic detection probability summaries that are based on searcher efficiency, carcass persistence, and average search interval that are stratified by the covariates or predictor variables selected for fatality estimation. While these detection probability summaries are not specifically used to provide a fatality rate estimate, an estimate of detection probability may provide useful planning insight (Simonis et al. 2018).

To determine median estimates, the number of parametric bootstrap iterations was set to 10,000 in GenEst and was used to build 90% confidence intervals around parameter estimates (Simonis et al. 2018). As this study focused on providing fatality estimates for bats only, size class was not included as a variable.

#### **3.2 DEFINITION OF VARIABLES**

Table 1 provides definitions for variables used in the GenEst statistical analysis.

**Table 1. Definitions of Variables Used in GenEst Analysis**

| Variable            | Definition   |
|---------------------|--|
| $p$                 | Searcher efficiency - the probability an observer will find a present carcass during the first search after it arrived   |
| $k$                 | The proportional change in searcher efficiency with successive searches  |
| $r_t$               | The estimated probability that a carcass arriving at a uniform random time in an interval of $t$ days persists until the end of the interval   |
| MedianCP            | The median number of days a carcass will persist after day 0   |
| $\bar{M}_i$         | The estimated number of carcasses falling within distance band $i$   |
| $\sum \bar{M}_i$    | The total number of estimated carcasses  |
| $f\bar{M}_i$        | The estimated proportion of carcasses falling within distance band $i$   |
| $X_i$               | The total number of carcasses observed within distance band $i$ , pooled across the entire wind facility   |
| $fA_{Avg_i}$        | The proportion of area surveyed in distance band $i$ averaged across all turbines  |
| $fA_{Search_{i,j}}$ | The proportion of area surveyed within distance band $i$ at turbine $j$  |
| $f_{within}$        | A correction factor representing the estimated proportion of fatalities occurring within the turbine search radius; this correction factor is applied to the calculated DWP for road and pad plots to account for carcasses falling outside of the search radius; for this study, this value was set to 0.95 |
| $DWP_j$             | The calculated, uncorrected DWP for turbine $j$  |
| $DWP_{C_j}$         | The corrected DWP value for turbine $j$ , this is the product of $DWP_j * f_{within}$  |
| $g$                 | The probability of detection   |

### 3.3 SEARCHER EFFICIENCY

Searcher efficiency is the probability that a searcher will find a carcass given that the carcass falls within the search area (Simonis et al. 2018). All trial carcasses were pooled to represent a single size class. Searcher efficiency was modeled separately for each season with two parameters:  $p$ , the probability that a present carcass is found during the first search after it arrived, and  $k$ , the proportional change in searcher efficiency with successive searches. *Plot Type* (full plot or road and pad plot) was included as a predictor variable. Data from each searcher efficiency trial were pooled each season, and searcher efficiency was modeled with  $k$  set at 0.75. While the searcher in this study had only one opportunity to find the trial carcass, data suggests that  $k$  tends to remain relatively consistent at 0.75 (Dalthorp 2019 pers. comm.).

GenEst provided corrected Akaike information criterion (AICc) results for two models per season (Table 2). AICc estimates the relative quality of statistical models for a given set of data. Models with lower AICc scores are generally considered to fit the data better while using fewer predictor variables.

**Table 2. Models Evaluated for Searcher Efficiency Trials**

| Model              | k value <sup>a</sup> | AICc <sup>b</sup> | ΔAICc <sup>c</sup> |
|--------------------|----------------------|-------------------|--------------------|
| <b>Spring</b>      |                      |                   |                    |
| $p \sim Plot Type$ | k fixed at 0.75      | 38.01             | 0.00               |
| $p \sim Constant$  | k fixed at 0.75      | 38.82             | 0.81               |
| <b>Summer</b>      |                      |                   |                    |
| $p \sim Plot Type$ | k fixed at 0.75      | 17.71             | 0.00               |
| $p \sim Constant$  | k fixed at 0.75      | 27.9              | 10.19              |
| <b>Fall</b>        |                      |                   |                    |
| $p \sim Plot Type$ | k fixed at 0.75      | 38.45             | 0.00               |
| $p \sim Constant$  | k fixed at 0.75      | 38.82             | 0.37               |

<sup>a</sup>k is the proportional change in searcher efficiency with successive searches. It remains fixed at 0.75 per D. Dalthorp (personal communication).

<sup>b</sup>AICc is the corrected Akaike's Information Criterion.

<sup>c</sup>ΔAICc is the difference in AICc values between a particular model and the top model. When comparing a set of models, lower ΔAICc values are generally considered better models.

The  $p \sim Plot Type$  model was selected for spring, summer, and fall fatality estimation (Table 3) as it had the lower AICc model for each season (spring ΔAICc = 0.81, summer ΔAICc = 10.19, and fall ΔAICc = 0.37 where ΔAICc is the difference between the model with the lowest and second lowest AICc value).

**Table 3. Searcher Efficiency and Carcass Persistence Models Selected for Fatality Estimation in GenEst**

| Analysis            | Model <sup>a</sup>  |
|---------------------|---|
| <b>Spring</b>       |   |
| Searcher Efficiency | $p \sim Plot Type$  |
| Carcass Persistence | exponential distribution; $l \sim Plot Type$                  |
| <b>Summer</b>       |   |
| Searcher Efficiency | $p \sim Plot Type$  |
| Carcass Persistence | loglogistic distribution; $l \sim Constant, s \sim Constant$  |
| <b>Fall</b>         |   |
| Searcher Efficiency | $p \sim Plot Type$  |
| Carcass Persistence | loglogistic distribution; $l \sim Constant, s \sim Plot Type$ |

<sup>a</sup>For carcass persistence, "l" refers to location and "s" refers to scale in GenEst. Exponential distributions are not modeled with a scale formula.

### 3.4 CARCASS PERSISTENCE

Carcass persistence is the probability that a carcass arriving on Day 0 will remain on Day  $t$  (e.g., despite scavenging or decomposition) (Simonis et al. 2018). All trial carcasses were pooled to

represent a single size class. For 40 trial carcasses per season, the last day of detection from Day 0 and first day of absence from Day 0 were input into GenEst with *Plot Type* used as predictor variable. Four distributions were modeled: exponential, Weibull, lognormal, and loglogistic. The resulting 14 models per season were compared using AICc (Appendix C), and the most parsimonious model was selected for each season (Table 3). The selected model for the spring was the exponential distribution with the location formula a function of plot type ( $\Delta AICc = 0.69$ ). The selected model for the summer was the loglogistic distribution with constant location and scale formulas ( $\Delta AICc = 1.05$ ). The selected model for the fall was the loglogistic distribution with constant location formula and scale formula a function of *Plot Type* ( $\Delta AICc = 1.33$ ).

### 3.5 DENSITY-WEIGHTED PROPORTION

DWP is the expected proportion of carcasses to fall within the searched area of each individual turbine (Simonis et al. 2018). This estimated value takes into consideration the distance of a carcass from the turbine as carcass density around a turbine may differ with increasing distance from the turbine (Hull and Muir 2010).

For road and pad plots, pooled counts of carcasses within 10 m distance bands were used to estimate the proportion of carcasses falling within each band,  $f\hat{M}_i$ , where  $i$  = the distance band (e.g., 0 to 10 m, out to a maximum of 80 m). These proportions were then multiplied by the turbine-specific proportion of searched area in the plot at each distance band,  $i$ . Only non-incident carcasses found during road and pad searches were used for DWP calculation.

Specifically,  $f\hat{M}_i = \hat{M}_i / \sum \hat{M}_i$  where  $\hat{M}_i = X_i / fA_{Avg_i}$  and  $\sum \hat{M}_i$  is the sum of  $\hat{M}$  across all distance bands.  $X_i$  is the number of pooled carcass observations in each distance band,  $i$ , and  $fA_{Avg_i}$  is the average proportion of area surveyed in each distance band,  $i$ , across all turbines. DWP at each turbine is then calculated as  $DWP_j = \sum (f\hat{M}_i * fA_{Search_{i,j}})$ , where  $j$  is the specific turbine number and  $fA_{Search_{i,j}}$  is the proportion of area surveyed within distance band  $i$  at turbine  $j$ .

The calculated DWP within the 80 m search radius ( $DWP_j$ ) was then adjusted to account for carcasses falling beyond the search radius using  $DWP_{C_j} = DWP_j * f_{within}$  where  $f_{within}$  is the estimated proportion of fatalities occurring within the search radius. For this study,  $f_{within}$  is determined from publicly available results from similar studies.

Turbine-specific road and pad DWPs were calculated based on bat fatalities observed during the 2021 monitoring season pooled across spring, summer, and fall to provide a larger sample size for calculating DWP. This DWP was used to calculate a fatality estimate for each season.

Hull and Muir (2010) reported percentile distances of the fall zone modeled for bats at small, medium, and large turbine sizes based on data from their study sites. For large size turbines (94 m

hub height and 112 m rotor diameter, similar to those in operation at the project), modeling suggested that 99% of bat carcasses fell within 66.46 m of the turbine (Hull and Muir 2010). This is less than the 80 m search radius of this study's road and pad plots; turbine-specific DWP values for road and pad plots were calculated as  $DWP_{C_j} = DWP_j * 0.99$ . The average corrected DWP for road and pad plots at the project in 2021 was 0.0672. The Fowler Ridge HCP adjusted this percentage for its square 80 m x 80 m full plots' dimensions to estimate that 23.4% of fatalities fell beyond its full plots (Good et al. 2012). Therefore, DWP values for full plot locations were set at 0.766 (i.e., approximately 76.6% of bat fatalities fall within the 80 m x 80 m square plot).

### 3.6 PROJECT-SPECIFIC FATALITY ESTIMATE

To calculate a fatality estimate using GenEst, searcher efficiency models and carcass persistence models were first selected for each season (see Sections 3.3 and 3.4 above; Table 3). For searcher efficiency, the "plot type" model ( $p \sim Plot Type$ ) was selected for all three seasons. For carcass persistence, an exponential distribution with the location formulas a function of plot type (i.e.,  $l \sim Constant$ ) was selected for spring. A loglogistic distribution with both location and scale formulas constant (i.e.,  $l \sim Constant$ ,  $s \sim Constant$ ) was selected for summer. A loglogistic distribution with a constant location formula and scale formula as a function of plot type ( $l \sim Constant$ ,  $s \sim Plot Type$ ) was selected for fall.

Other inputs required to calculate mortality in GenEst included the *Fraction of Facility Surveyed*, turbine-specific *Density-Weighted Proportions* (discussed above), and the *Observation Date* for each carcass found. GenEst combines the carcass *Observation Date* with *Turbine Search Schedule* (uploaded to GenEst as a separate database) to estimate detection probability following arrival (Simonis et al. 2018). All 57 turbines within the project were surveyed for carcasses in the spring and fall. Therefore, *Fraction of Facility Surveyed* was set to 1 for these seasons. In the summer, all 32 turbines within the bat avoidance buffer were surveyed. These turbines were operating with a different cut-in speed than turbines outside of the bat avoidance buffer. Therefore, *Fraction of Facility Surveyed* was also set to 1 to provide a summer fatality estimate for turbines only within the bat avoidance buffer. *Density-weighted Proportion* and *Turbine Search Schedule* are provided as separate CSV files that are uploaded to GenEst.

### 3.7 EVIDENCE OF ABSENCE

Evidence of Absence (EoA) software version 2.0 (Dalthrop et al. 2017) single class and multiple classes modules were used to model estimated take of federally endangered Indiana bats and federally threatened northern long-eared bat during the monitoring period. EoA uses several parameters to estimate a detection probability ( $g$ ), which is ultimately used to estimate take levels at a user-defined credibility level. Detection probability is a function of search interval, timespan of survey effort, spatial ( $a$ ) and temporal ( $v$ ) coverage, searcher efficiency ( $p$ ), the factor

by which searcher efficiency changes between subsequent searches ( $k$ ), carcass persistence ( $r$ ), and carcass count ( $X$ ).

EoA’s single class module was first used to determine detection probabilities and 95% confidence intervals for spring, summer, and fall. Inputs used for each season’s analysis are provided in Table 4.

**Table 4. Seasonal Inputs used for Single Class Module Analysis in Evidence of Absence**

| Variable   | Spring         | Summer         | Fall             |
|--|----------------|----------------|------------------|
| <b>Search Schedule</b>   |                |                |                  |
| Start of monitoring  | 2021-04-05     | 2021-05-17     | 2021-08-02       |
| Search interval (days)   | 7              | 7              | 7                |
| Number of searches   | 6              | 11             | 11               |
| Spatial coverage (a)   | 0.2878         | 0.2828         | 0.2878           |
| Temporal coverage (v)  | 1              | 1              | 1                |
| <b>Searcher Efficiency</b>   |                |                |                  |
| Carcasses available  | 39             | 39             | 39               |
| Carcasses found  | 32             | 35             | 32               |
| Factor by which searcher efficiency changes with each search ( $k$ ) | 0.75           | 0.75           | 0.75             |
| <b>Persistence Distribution (from field trials)</b>                  |                |                |                  |
| Distribution   | Exponential    | Lognormal      | Lognormal        |
| Shape  | 0.11772        | 2.0378         | 2.0706           |
| Scale  | 8.495          | 1.7851         | 0.58699          |
| 95% confidence interval for scale                                    | [6.148, 11.74] | [1.315, 2.255] | [0.08742, 1.087] |
| <b>Fatality Estimation</b>   |                |                |                  |
| Carcass count ( $X$ )  | 0              | 0              | 0                |
| Credibility level  | 0.5            | 0.5            | 0.5              |

Mortality monitoring began on April 5, 2021, May 17, 2021, and August 2, 2021 for spring, summer, and fall seasons, respectively. Surveys were conducted once per week for six weeks in the spring and 11 weeks in the summer and fall. Temporal coverage was set to 1 for all seasons in order to keep the period of inference restricted to the season in question.

Spatial coverage was the average DWP (see Section 3.5) for turbines searched during each season. Therefore, spatial coverage in spring and fall (all 57 turbine plots searched) was 0.2878. In the summer (32 turbine plots within the bat avoidance buffer searched), spatial coverage was

0.2828. It was assumed that no take of covered species occurred outside of the bat habitat avoidance buffer during the summer.

Searcher efficiency and carcass persistence data collected during the fall season were based on field trials, and the results were entered into EoA. The factor by which searcher efficiency changes between subsequent searches was set to 0.75 (Dalthorp 2019 pers. comm.) and exponential (spring) and lognormal (summer and fall) persistence distributions were selected as they were recommended as the most appropriate models by EoA. While EoA recommended the lognormal models for summer and fall, it is worth noting that these models did not have the lowest AICc values (though  $\Delta AICc$  values were less than 2.0 for both seasons). No Indiana or northern long-eared bat carcasses were found over the course of standardized surveys in spring, summer, or fall. Therefore, carcass count was set to 0 for all seasons. The credibility level was set to 0.5 for all seasons as this value provides a median estimate. Searcher efficiency and carcass persistence estimates using EoA are provided in Section 4.5.

Associated Ba and Bb values, which are parameters that characterize the detection probability, are also provided with the EoA output. These Ba and Bb values (see Section 4.6) were then plugged into EoA's multiple classes module to provide a single combined take estimate for the monitoring period. Data was entered manually into the multiple classes module with each season representing a different class. EoA multiplies the detection probability for each class by a relative weight referred to in EoA's multiple classes module as "dwp." However, for purposes of this study, the multiple classes dwp is based on estimated seasonal proportions of Myotis activity described in the HCP for Bluff Point (Atwell 2021) and is not the same as the DWP described in Section 3.5, above. Spring, summer, and fall were assigned weights of 0.04, 0.30, and 0.66, respectively. Spatial coverage for each season was previously accounted for during the single class module analysis. As with the single class module, the carcass counts were set to 0 and the credibility levels set to 0.5 for all seasons.

Annual take estimates ( $M^*$ ) will be tracked with a 50% credibility level over the life of the ITP using the "Track past mortality" option in EoA's multiple years module.

### 3.7.1 Adaptive Management Triggers

The EoA software has incorporated a framework that addresses specific adaptive management "triggers" to help ensure permit compliance and potentially alleviate the project from current AMMs described in Section 6.2 of the HCP (Atwell 2021). Adaptive management triggers built into the software include the short-term trigger, long-term trigger, and reversion trigger (Dalthorp et al. 2017) and are described below:

- The short-term trigger acts as a warning tool and fires when the annual fatality rate is greater than a given threshold over the course of one or a few years. BPW will utilize a 3-

year window for the short-term trigger against the estimated annual take (5.5 Indiana bats and 2.8 northern long-eared bats) with a 99% credibility level (Atwell 2021), as recommended by the software to protect against the trigger firing unnecessarily (Dalthorp et al. 2017). The short-term trigger was not applicable to the 2021 monitoring results as it was the first year of monitoring under the HCP and ITP.

- The long-term trigger indicates when total cumulative take has exceeded the authorized threshold (i.e., 165 Indiana bats and 84 northern long-eared bats) with a certain credibility level. As described above, BPW will track estimated cumulative take ( $M^*$ ) using EoA's multiple years module with a 50% credibility level. This credibility level was determined to most accurately track fatality rates over time while reducing the likelihood of a false trigger (i.e., firing before the cumulative take limit has been exceeded) (Dalthorp et al. 2017).
- The reversion trigger indicates when fatality rates are low enough to allow for a less restrictive operational minimization strategy that will not result in annual fatality rates exceeding the take limit at a given credibility level. BPW expects to reduce the annual take of Indiana bats from 5.5 to 2.09 bats and northern long-eared bats from 2.8 to 1.07 bats. BPW will use the reversion test against the lesser of the expected take threshold (i.e., 2.09 Indiana bats and 1.07 northern long-eared bats) or the average annual take rate as calculated using EoA after three years of baseline monitoring. BPW will initially run the reversion test with a 99% credibility level and 50% assumed relative mortality rate ( $p$ ) in Year 6, allowing for 3 years of Baseline Monitoring and 3 years of Implementation Monitoring to be completed prior to considering reducing AMMs.

## 4 RESULTS

### 4.1 BAT FATALITY SURVEYS

Throughout the spring, summer, and fall seasons at the project, 897 road and pad plot and 414 full plot searches were completed during standardized surveys. During the study, 134 bats representing six species were found during standardized searches across 39 turbine locations (Figures 5a-c), including eastern red bat (*Lasiurus borealis*; 52 fatalities), silver-haired bat (*Lasionycteris noctivagans*; 47 fatalities), hoary bat (*Lasiurus cinereus*; 17 fatalities), big brown bat (*Eptesicus fuscus*; 13 fatalities), Seminole bat (*Lasiurus seminolus*; one fatality) and evening bat (*Nycticeius humeralis*; one fatality). Three bats were identified as either eastern red bat or Seminole bat but could not be identified to species (Appendix B-1). Avian fatalities were not included in analysis; however, a list of avian fatalities found during searches is provided in Appendix B-2.

Of the 134 bats included in the analysis, four fatalities (3.0%) were found during the spring season, 11 fatalities (8.2%) were found during the summer season, and 119 fatalities (88.8%) were found during the fall season (Table 5).

**Table 5. Total Bat Fatalities Found during Standardized Searches by Season**

| Season | Total Bats <sup>a</sup> | Percentage |
|--------|-------------------------|------------|
| Spring | 4                       | 3.0%       |
| Summer | 11                      | 8.2%       |
| Fall   | 119                     | 88.8%      |
| Total  | 134                     | 100.0%     |

<sup>a</sup> Incidental finds were excluded from analysis and are not included in this table.

Most bat fatalities were found at full plots compared to road and pad plots (87 fatalities, or 64.9% at full plots; 47 fatalities, or 35.1% at road and pad plots). At full plots, a majority of fatalities were found within 30 m of the turbine (58.6%). At road and pad plots, a majority of fatalities were found within 10 m of the turbine (51.1%). A breakdown of the distribution of bat fatalities at each plot type is provided in Table 6.

**Table 6. Total Counts of Bat Fatalities by Plot Type and Distance from Turbine**

| Distance Band (m) | Fatalities at Full Plots <sup>a</sup> | Percentage of Fatalities <sup>a, b</sup> (Full Plots) | Fatalities at Roads/Pads Plots | Percentage <sup>b</sup> of Fatalities (Road and Pad Plots) | Total Standardized Fatalities <sup>c</sup> | Percentage of Fatalities <sup>b</sup> (All Plots) |
|-------------------|---------------------------------------|---|--------------------------------|--|--|---|
| 0 to 10           | 10                                    | 11.5%   | 24                             | 51.1%  | 34   | 25.4%   |
| 10 to 20          | 19                                    | 21.8%   | 4                              | 8.5%   | 23   | 17.2%   |
| 20 to 30          | 22                                    | 25.3%   | 7                              | 14.9%  | 29   | 21.6%   |
| 30 to 40          | 24                                    | 27.6%   | 4                              | 8.5%   | 28   | 20.9%   |
| 40 to 50          | 11                                    | 12.6%   | 3                              | 6.4%   | 14   | 10.4%   |
| 50 to 60          | 1                                     | 1.1%  | 2                              | 4.3%   | 3  | 2.2%  |
| 60 to 70          | N/A                                   | N/A   | 2                              | 4.3%   | 2  | 1.5%  |
| 70 to 80          | N/A                                   | N/A   | 1                              | 2.1%   | 1  | 0.7%  |
| Total             | 87                                    | 64.9%   | 47                             | 35.1%  | 134  | 100.0%  |

<sup>a</sup> N/A indicates not applicable. The maximum distance a fatality could be found within the standardized 80 m x 80 m full plot was approximately 56.7 m (i.e., the corner of the square plot).

<sup>b</sup> Percentage of fatalities for each distance band is based on the total number of standardized fatalities for each plot type. The total percentage for each plot type is based on all plots combined.

<sup>c</sup> Incidental finds were excluded from analysis and are not included in this table.

## 4.2 SENSITIVE SPECIES

A total of two state-endangered evening bats were found over the course of spring, summer, and fall surveys. Both evening bats were found during the early part of the summer (May 21, 2021 and

May 26, 2021). One of these bats was found during a standardized survey at turbine 36 (full plot) whereas the other was located incidentally at turbine 51 (road and pad plot).

No federally listed species were found during standardized surveys or incidentally in the spring, summer, or fall. Section 4.6 provides take estimates for federally listed Indiana and northern long-eared bats, which are species covered under the HCP (Atwell 2021).

### 4.3 SEARCHER EFFICIENCY

In all, 120 trial carcasses were placed throughout the study period. Forty carcasses were placed at search plots each season. Thirty carcasses were placed at full plot locations and 90 were placed at road and pad plot locations. Three carcasses were scavenged prior to the search (one each during the spring and summer at a full plot and one during the fall at a road and pad plot) and were subsequently removed from the searcher efficiency calculation. Searcher efficiency was higher at road and pad plots (87.5%, 98.3%, and 88.9% in spring, summer, and fall, respectively; Table 7) compared to full plots (57.1%, 55.6%, and 66.7% in spring, summer, and fall, respectively; Table 7). Searcher efficiency among seasons was relatively similar overall with 82.1% in the spring and fall, and 89.7% in the summer (Table 7).

**Table 7. Searcher Efficiency Estimates by Season and Plot Type**

| Predictor Variable | n <sup>a</sup> | p <sup>b</sup> | 90% Confidence Interval |       |
|--------------------|----------------|----------------|-------------------------|-------|
| <b>Spring</b>      |                |                |                         |       |
| Road and Pad Plots | 32             | 0.875          | 0.744                   | 0.944 |
| Full Plots         | 7              | 0.571          | 0.275                   | 0.824 |
| Overall            | 39             | 0.821          | 0.697                   | 0.901 |
| <b>Summer</b>      |                |                |                         |       |
| Road and Pad Plots | 30             | 0.983          | 0.918                   | 0.997 |
| Full Plots         | 9              | 0.556          | 0.293                   | 0.790 |
| Overall            | 39             | 0.897          | 0.786                   | 0.954 |
| <b>Fall</b>        |                |                |                         |       |
| Road and Pad Plots | 27             | 0.889          | 0.745                   | 0.956 |
| Full Plots         | 12             | 0.667          | 0.442                   | 0.846 |
| Overall            | 39             | 0.821          | 0.697                   | 0.901 |

<sup>a</sup> n is the number of carcasses placed for the searcher efficiency trial excluding carcasses scavenged prior to search.

<sup>b</sup> p is the calculated searcher efficiency.

### 4.4 CARCASS PERSISTENCE

In all, 120 trial carcasses were placed throughout the study period (40 per season). By mid-trial (day 14), 10 (25%), 10 (25%), and four (10%) carcasses were remaining in the spring, summer, and

fall, respectively. By the end of the trial (day 30), zero (0%), five (12.5%), and two (5%) carcasses were remaining in the spring, summer, and fall, respectively.

The estimated overall median probabilities of persisting to day 3 were 0.84, 0.85, and 0.59 in spring, summer, and fall, respectively (Table 8; Figures 6a-c). The estimated overall median probabilities of persisting to day 7 were 0.68, 0.69 and 0.38 in spring, summer, and fall, respectively (Table 8; Figures 6a-c). In general, the probability of persisting throughout the entire 30-day trial period was similar for the spring and summer seasons, but lower in the fall (0.29, 0.35, and 0.15 by day 28 for spring, summer, and fall respectively; Table 8; Figures 6a-c). These estimates do not represent the proportion of carcasses remaining at the end of an interval of  $t$  days (where  $t = 1, 3, 7, 14, \text{ or } 28$  days) but rather the probability that a carcass arriving within an interval of  $t$  days persists until the end of the interval.

**Table 8. Carcass Persistence Estimates by Season and Plot Type**

| Plot Type                       | n <sup>a</sup> | Median CP <sup>b</sup> | 90% CI |       | Probability of Persistence <sup>c</sup> |        |                |        |                |        |                 |        |                 |        |      |      |      |      |      |

<sup>a</sup> n is the number of carcasses placed for the carcass persistence trial.

<sup>b</sup> MedianCP is the estimated median number of days a carcass will persist after day 0.

<sup>c</sup> Probability of persistence is the estimated median probability that a carcass arriving at a uniform random time in an interval of t days (i.e., 1, 3, 7, 14, 28 days) persists until the end of the interval.

<sup>d</sup> In spring and fall, overall estimates were determined using a loglogistic distribution with constant location and scale formulas; however, this model was not selected for fatality estimation.

<sup>e</sup> In summer, estimates for road and pad plots and full plots were determined using a loglogistic distribution with the location formula a function of plot type and scale formula constant; however, this model was not selected for fatality estimation.

## 4.5 PROJECT-SPECIFIC FATALITY ESTIMATION

In total, 134 bat fatalities (Appendix B-1) were found during standardized searches and input into GenEst to calculate adjusted project-specific fatality estimates for each season. The probability of detection (*g*) tended to be higher at road and pad plot locations compared to full plot locations. Detection probability was similar overall for the spring and summer, but lower in the fall (Table 9). As previously mentioned, the *g*-values provided in GenEst (and presented in Table 9) are a simplistic estimate based on searcher efficiency estimates, carcass persistence estimates, and the average search interval. However, these estimates do not incorporate spatial coverage of survey plots (i.e., DWP).

**Table 9. Detection Probability Estimates by Season and Plot Type**

| Plot Type            | Estimated Detection Probability ( <i>g</i> ) | 90% Confidence Interval (lower) | 90% Confidence Interval (upper) |
|----------------------|--|---------------------------------|---------------------------------|
| <b>Spring</b>        |  |                                 |                                 |
| Road and Pad Plots   | 0.596  | 0.491                           | 0.684                           |
| Full Plots           | 0.537  | 0.291                           | 0.718                           |
| Overall <sup>a</sup> | 0.622  | 0.534                           | 0.699                           |
| <b>Summer</b>        |  |                                 |                                 |
| Road and Pad Plots   | 0.676  | 0.585                           | 0.767                           |
| Full Plots           | 0.457  | 0.267                           | 0.614                           |
| Overall <sup>b</sup> | 0.637  | 0.541                           | 0.731                           |
| <b>Fall</b>          |  |                                 |                                 |
| Road and Pad Plots   | 0.327  | 0.242                           | 0.418                           |
| Full Plots           | 0.322  | 0.208                           | 0.412                           |
| Overall <sup>a</sup> | 0.326  | 0.245                           | 0.411                           |

<sup>a</sup> The overall detection probability in spring and fall was determined using constant searcher efficiency and carcass persistence models, which were not selected for fatality estimation in GenEst.

<sup>b</sup> The overall detection probability in summer was determined using constant searcher efficiency and carcass persistence models. A constant carcass persistence model was used for fatality estimation in GenEst, though a constant searcher efficiency model was not.

The median fatality estimate was highest in the fall (39.14 bat fatalities/turbine or 18.64 bat fatalities/MW) followed by the summer (2.23 bat fatalities/turbine or 1.06 bat fatalities/MW) then spring (1.96 bat fatalities/turbine or 0.93 bat fatalities/MW) (Table 10).

**Table 10. Bat Fatality Estimates by Season**

| Season                          | Total Bats <sup>a</sup> | Percentage <sup>b</sup> | Median Fatality Estimate | 90 % Confidence Interval (lower) | 90 % Confidence Interval (upper) |

<sup>a</sup> Incidental finds were excluded from analysis and are not included in this table.

<sup>b</sup> Percentage is the percent of total bats found during each season.

<sup>c</sup> Based on 57 turbines for spring and fall, and 32 turbines for summer.

<sup>d</sup> Based on 119.7 MW for spring and fall, and 67.2 MW for summer

## 4.6 ESTIMATED TAKE OF COVERED SPECIES

No species covered under the HCP were found during surveys in the spring, summer, or fall.

Results from the searcher efficiency and carcass removal trials, as well as the site coverage were input into EoA to model estimated Indiana and northern long-eared bat take. Using the single class module, EoA estimated searcher efficiency to be 0.821 (95% confidence interval: 0.680, 0.916) in the spring and fall, and 0.897 (95% confidence interval: 0.774, 0.964) in the summer. Carcass persistence (*r*) was estimated to be 0.681 (95% confidence interval: 0.597, 0.753) in the spring, 0.678 (95% confidence interval: 0.568, 0.775) in the summer, and 0.397 (95% confidence interval: 0.292, 0.514) in the fall. Resulting Ba and Bb values, as well as detection probabilities, that were input into the multiple classes module for each season are shown in Table 11.

**Table 11. Seasonal Inputs used for Multiple Classes Module Analysis in Evidence of Absence**

| Class  | dwp <sup>a</sup> | Carcass Count (X) | B <sub>a</sub> <sup>b</sup> | B <sub>b</sub> <sup>b</sup> | Detection Probability (g) | 95% Confidence Interval for g (lower limit) | 95% Confidence Interval for g (upper limit) |
|--------|------------------|-------------------|-----------------------------|-----------------------------|---------------------------|---|---|
| Spring | 0.04             | 0                 | 121.9011                    | 602.8984                    | 0.1682                    | 0.1420                                      | 0.1960                                      |
| Summer | 0.30             | 0                 | 94.3541                     | 437.9089                    | 0.1773                    | 0.1460                                      | 0.2110                                      |
| Fall   | 0.66             | 0                 | 35.7104                     | 330.9424                    | 0.0974                    | 0.0692                                      | 0.1300                                      |

<sup>a</sup> dwp is a relative weight assigned to the detection probability. For purposes of this study, the dwp used in the multiple classes module analysis is based on estimated seasonal proportions of *Myotis* activity described in the HCP for Bluff Point (Atwell 2021) and is not the same as the DWP used for GenEst analysis.

<sup>b</sup> B<sub>a</sub> and B<sub>b</sub> values for each season were determined from single class module analysis.

Given that no Indiana bat or northern long-eared bat carcasses were found during standardized surveys (X = 0 for both species), the median fatality estimate for each species was one fatality in 2021. The estimated overall detection probability was 0.124 (95% confidence interval: 0.103, 0.147; B<sub>a</sub> = 104.5216 and B<sub>b</sub> = 737.1087) and the mean mortality rate ( $\lambda$ ) was 4.08 (95% confidence interval: 0.004, 20.570). EoA outputs are provided in Appendix D.

## 5 DISCUSSION

Over the course of the study, 134 bat fatalities representing six species were found during standardized surveys. Using GenEst, the estimated adjusted fatality rates in the spring, summer, and fall were 1.96 bats/turbine (0.93 bats/MW), 2.23 bats/turbine (1.06 bats/MW), and 39.14 bats/turbine (18.64 bats/MW), respectively. While the spring and fall fatality estimates were for all 57 turbines at the project, the summer fatality estimate was only for 32 turbines within the bat avoidance buffer. This is because all turbines were surveyed and operating at a 3.0 m/s and 5.0 m/s cut-in speed during the spring and fall, respectively, whereas only turbines within the bat avoidance buffer were surveyed and operating at a 6.0 m/s cut-in speed in the summer. Turbines located outside of the bat avoidance buffer were not surveyed in the summer and were operating at the manufacturer’s recommended cut-in speed (3.0 m/s).

Eastern red bats, silver-haired bats, and hoary bats made up a majority of the fatalities found at the project and are similar to the species composition found at other wind facilities throughout the Midwest, though specific proportions of each species may differ (Arnett et al. 2008). Based on the timing of peak fatality, it is likely that these were fall migrants. No species listed as federally threatened or endangered were found during the 2021 study period; however, two state-endangered evening bats were found, including one standardized detection and one incidental detection.

Bat fatality counts were low throughout the spring and summer but higher in the fall, with fatality counts generally peaking in early to mid-September (Figure 7). While this pattern may be partially

attributed to a lower turbine cut-in speed during the fall monitoring period compared to the summer monitoring period, this temporal influx of fatalities at the project is also similar to trends from other wind facilities throughout the U.S. A majority of bat fatalities tend to correspond with the fall migratory period and dispersal from summer breeding grounds compared to the spring and summer seasons (Johnson 2005; Arnett et al. 2008; AWWI 2018). The timing of peak fatality counts is generally driven by an influx of silver-haired bats at the project in early to mid-September, though fatality counts for other species tended to peak two to three weeks earlier (i.e., mid to late August) (Figure 8).

In the spring and summer, bat fatalities at the project were generally distributed throughout the array and there did not appear to be any areas of concentration (Figures 5a-b). In the fall, total bat fatality counts tended to be higher at turbines in the western portion of the project. In particular, full plots seemed to show a decreasing trend from west to east where full plots on the western side of the project had the highest total bat fatality counts and full plots on the eastern side of the project tended to have the lowest bat fatality counts (Figure 5c). On an individual turbine basis, full plots had more observed bat fatalities at the project than road and pad plots. This was expected since full plots have a greater amount of area searched compared to roads and pads, particularly at distance bands closer to the turbine tower where a greater proportion of fatalities are likely to be found (Hull and Muir 2010).

As previously mentioned, no species covered under the HCP were detected during PCMM surveys and the cumulative take after one year of monitoring, based on modelling, is estimated to be one Indiana bat and one northern long eared bat. The long-term trigger threshold has not been exceeded for either species. As this was the first year of baseline monitoring under the HCP, the short-term trigger is not applicable since a minimum of three years of monitoring data will be used to determine if the project is at risk of exceeding its take limit. Long-term progress toward the total authorized take limit will be tracked over the life of the ITP using EoA's multiple years module.

### WTG0002 Wind Speed vs Blade Rotor Speed

### WTG0002 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0002 for 05-06-2021.

|                           |          |              |                |

### WTG0002 Wind Speed vs Blade Rotor Speed

### WTG0002 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

# Bluff Point Curtailment Data Report for Turbine WTG0002 for 05-28-2021.

### WTG0002 Wind Speed vs Blade Rotor Speed

### WTG0002 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0002 for 07-20-2021.

### WTG0002 Wind Speed vs Blade Rotor Speed

### WTG0002 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0002 for 10-11-2021.

### WTG0014 Wind Speed vs Blade Rotor Speed

### WTG0014 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0014 for 08-02-2021.

|                           |          |              |                |

### WTG0014 Wind Speed vs Blade Rotor Speed

### WTG0014 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0014 for 09-17-2021.

|                           |           |              |                |

### WTG0014 Wind Speed vs Blade Rotor Speed

### WTG0014 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0014 for 10-11-2021.

### WTG0031 Wind Speed vs Blade Rotor Speed

### WTG0031 Time Series Plot of Ambient Temperature, Wind Speed, and Blade Rotor Speed

## Bluff Point Curtailment Data Report for Turbine WTG0031 for 05-06-2021.

|                           |          |              |                |
